

The composition of the mohorins (*Messerschmidia* *rectula*) resins. M. Pyatnitskii, *Vsesoyuz. Inst. Teksobr. i Melkorach.* *TMZh*, No. 133, 19-37 (in English 37-8) (1937). Pound. leaves washed with warm water, until no test for nicotine was obtained, were dried at 35-40° and extd. with benzene. They contained: 3.34% hydrocarbons, 31.1% resins, minute quantities of esters, 14.63% fatty acids, 15.24% oxy- and phenol acids and 2.84% of unknown substances. Their sapon. is described.

Title : Glomerulonephritis as an Inflammatory Process

Orig Pub : Arkhiv patologii, 1957, 19, № 12, 60-65

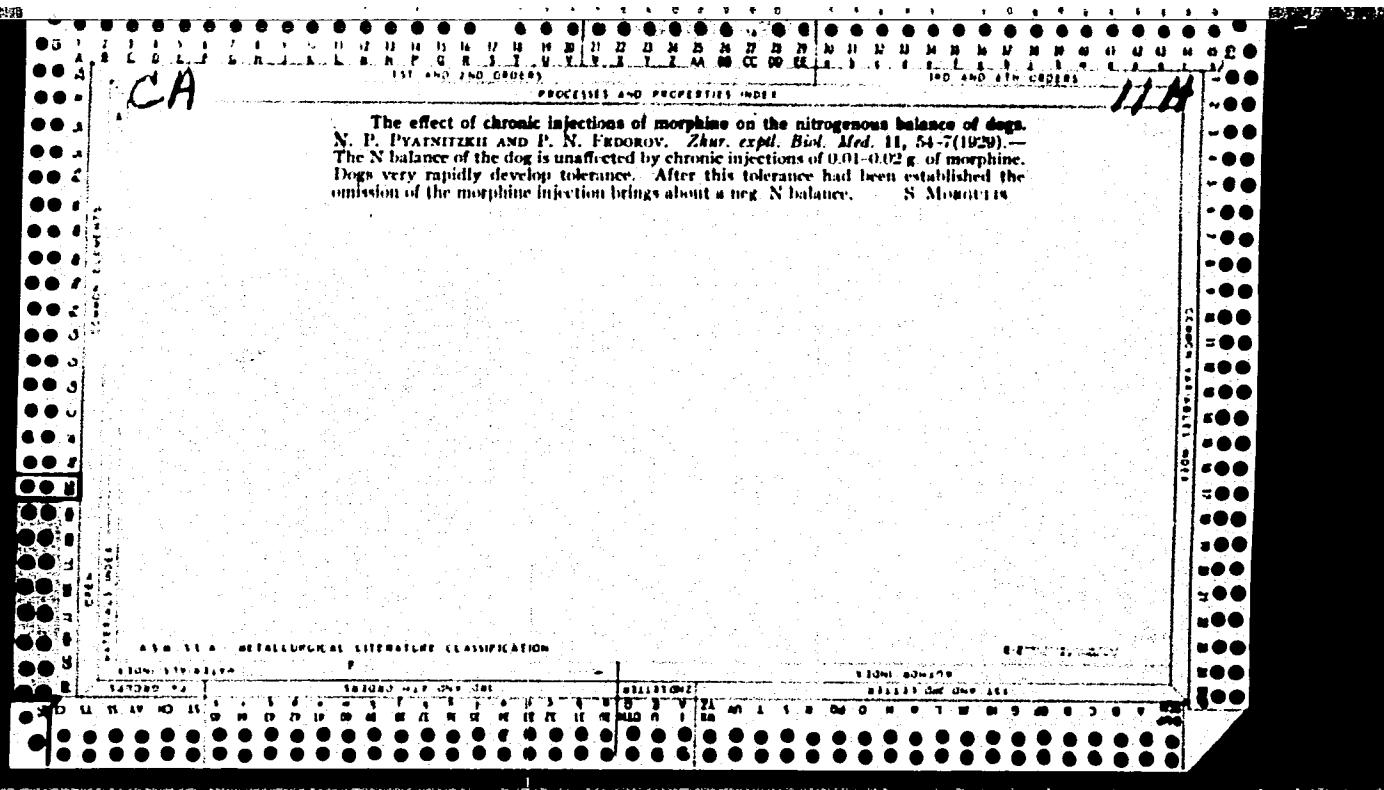

Abstract : In experimental nephritis produced in rabbits by the injection of nephrotoxic serum, the adsorption of trypan blue and microbial bodies injected into the bloodstream was not observed in the renal tubules. A reduction in temperature, rather than hyperthermia, was detected in the cortical layer of the kidneys. The absence of these fundamental signs of inflammation provides grounds for denying the inflammatory nature of glomerulonephritis.

Abt Jour : Ref Zhur - Biol., No 2, 1958, 5861

Author : Pyatnitskiy, S.S.

Inst : Khar'kov Agricultural Institute.

Title : Hardiness, Longevity, and Reproducibility of Steppe Forests

Orig Pub : Zap. Khar'kovsk. s.-kh. in-ta, 1955, 10, (47), 3-14

Abstract : The explanations of the lesser longevity of steppe forests as compared with forests of the forest zone should not be considered exhaustive inasmuch as they do not take into account the growth phase of the trees in calculating the environmental influence. By analysis with the cambium's change in productivity it has been established that forest plants on the steppe have a quicker phasal development than those of the wooded steppe and the forest zone. The tree's vitality here depends more upon its phasal development

TITLE : Hybrids Between Species of the Genus
Quercus L.

ORIG. PUB. : Zap. Khar'kovsk. s.-kh. in-ta, 1957, 16(53),
197-222

ABSTRACT : A brief review of systematics of the genus Quercus, and a synopsis of data concerning natural hybridization between different species of this genus. It is noted that at the present time there have been discovered 108 natural hybrids between species and subspecies, and a list of them is given. A synopsis is also presented of data concerning experimental hybridization in the genus Quercus. The author started work on hybridization of oak in 1937; up to 1957 he has carried out 195,678 pollinations from which 13,674 acorns were obtained. In some of the combinations the percentage of acorn formation was as high as 50-60%. A table is included which shows to what extent

SUMMARY :

INT'L. :

ORIG. PUB. :

ABSTRACT : the crossing of different species and groups of oak has been successful. Up to now there have been obtained 17 different hybrids between species and subspecies (a trich. is included). Of these, 8 are analogous to hybrids which arose spontaneously in nature. Altogether, at the present time, there are 147 hybrids of the genus Quercus. A characterization is given of the F₁ hybrids of some of the combinations, from which it is apparent that, as a rule, the hybrids are of an intermediate nature. The author notes the greater influence of the maternal form. Not infrequently the F₁ exhibit the non-uniform nature of hybrids, which is due, apparently, to the hybrid-nature of the initial, parental forms. The hybrids show variability

ABSTRACT : with age, mainly in morphology of the leaves Data are presented concerning fruit-bearing of hybrids and of their offspring. It is emphasized that hybrids between species of oak bear well. The oaks developed by the author began to bear fruit at the age of 6-8 years; particularly productive are the Timiryazev's oak, Komarov's oak, and Vysotskiy's oak. In the second generation there is usually observed a complex separation of characteristics. Many of the natural and of the artificially produced oak hybrids show heterosis, for example, the oaks of Timiryazev and of Vysotskiy. Photosynthesis takes place much more intensely in the oak hybrids, than in the initial forms, which may be

TITLE: Some special construction features of an ultrasonic defectoscope DUK-12

SOURCE: Defektoskopiya, no. 6, 1965, 68-76

TOPIC TAGS: defectoscope, ultrasonics, fiber glass, electric circuit, electronic equipment/ DUK-12 defectoscope

ABSTRACT: The special features of an ultrasonic defectoscope DUK-12 are discussed. The device is used to investigate the physico-mechanical characteristics of fiber-glass parts and their acoustic characteristics in laminated structures. The block diagram of the instrument is shown in Fig. 1. It operates on the principle of sound wave reflections from the specimen at ultrasonic frequencies. Some of the operating characteristics of the instrument are: 0.8 Mcycles frequency, minimum area for defect identification, 20 mm² area, operating voltages of 24, 36, and 220 volts at 50-cycle frequency, weight 19 kg. The

Ultrasonic flaw detection in structural glass plastics (Ul'trazvukovaya defektoskopiya konstruktsionnogo stekloplastika) Leningrad, 1965. 23 p. illus., biblio.

Series note: Leningradskiy dom nauchno-tehnicheskoy propagandy.. Proizvodstvennyy opyt. Seriya: Elektrofizicheskiye i elektrokhimicheskiye metody obrabotki metallov.

TOPIC TAGS: reinforced plastic, ultrasonic inspection, DUK 12 flaw detector, ultrasonic flaw detection, glass fiber, ultrasonic equipment / ↵

PURPOSE AND COVERAGE: This pamphlet describes the DUK-12 ultrasonic flaw detector developed at the All-Union Scientific Research Institute for Non-destructive Testing and Quality Control (VNIINK), Kishinev. It serves as a flaw detector and thickness gauge of glass fiber reinforced plastics used for structural materials. The minimum surface is 20 mm², the thickness range is 3 to 30 mm, power source requirement is 200 v, operational frequency is 0.8 Mc, and the screen is 120 mm in diameter. The DUK-12 was approved for serial production at the "Elektrotochpribor" Plant, Kishinev, as the first Soviet device for quality control of glass fiber reinforced plastics.

TITLE: Recent means of flaw detection in certain fiberglass structures

SOURCE: Plasticheskiye massy, no. 10, 1965, 44-52

TOPIC TAGS: fiberglass, ultrasonic flaw detector, nondestructive test, quality control, ultrasonic inspection, x ray analysis

ABSTRACT: A number of nondestructive methods for detecting flaws in fiberglass are evaluated to determine the best means for quality control. The ultrasonic echo method may be expediently used for inspecting glued joints and for quality control of different bulky structures. Vibration control methods are recommended for checking the quality of gluing metal, wood and concrete structures with fiberglass and other plastics. The ultrasonic shadow method is recommended for quality control of small articles and mass production items. Thickness of material at any point in the structure can be determined accurately by the ultra-
